

Disks and Files (Part 2)

(Chapter 9 of textbook)

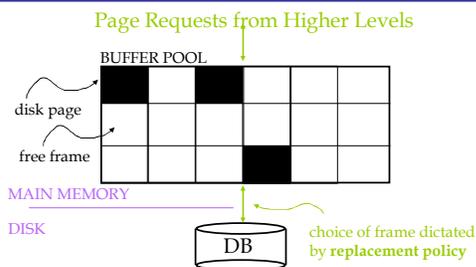

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

Outline

- Disk technology and how to make disk read/writes faster (last time)
- Buffer management
- Storing “database files” on disk

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

Buffer Management in a DBMS

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

When a Page is Requested ...

* If requests can be predicted (e.g., sequential scans) pages can be *pre-fetched* several pages at a time!

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

More on Buffer Management

- Requestor of page must unpin it, and indicate whether page has been modified
- Page in pool may be requested many times
- CC & recovery may entail additional I/O when a frame is chosen for replacement.

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

In Class Exercise

- What happens if the buffer is full and all frames have pin count > 0?
- What happens if multiple transactions (users) want to access the same page?

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

In Class Exercise Solution

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

Buffer Replacement Policy

- Frame is chosen for replacement by a *replacement policy*:
 - Least-recently-used (LRU)
 - Clock
 - Many others
 - First-in-first-out (FIFO), Most-recently-used (MRU), Random

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

Buffer Replacement Policy (Contd.)

- Policy can have big impact on # of I/O's; depends on the *access pattern*.
- *Ex: Sequential flooding*

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

DBMS vs. OS File System

OS does disk space & buffer mgmt: why not let OS manage these tasks?

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

Outline

- Disk technology and how to make disk read/writes faster (last time)
- Buffer management
- Storing “database files” on disk

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

Files of Records

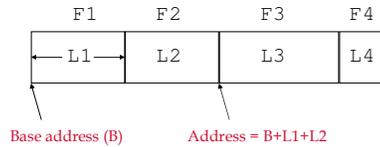

- Page or block is OK when doing I/O, but higher levels of DBMS operate on *records*, and *files of records*.
- **FILE**: A collection of pages, each containing a collection of records. Must support:

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

Things to decide

- Record format
- Page format
- File format

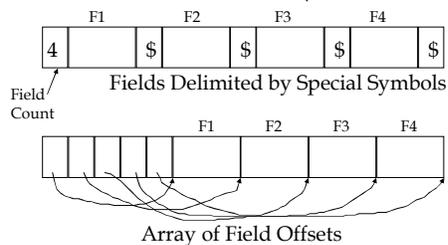

Record Formats: Fixed Length

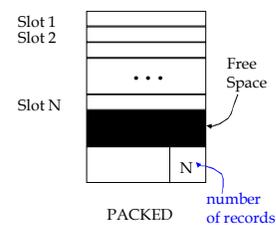

- Information about field types same for all records in a file; stored in *system catalogs*.
- Finding *i*'th field requires scan of record.

Record Formats: Variable Length

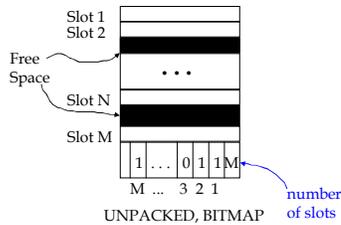

- Two alternative formats (# fields is fixed):

Page Formats: Fixed Length Records

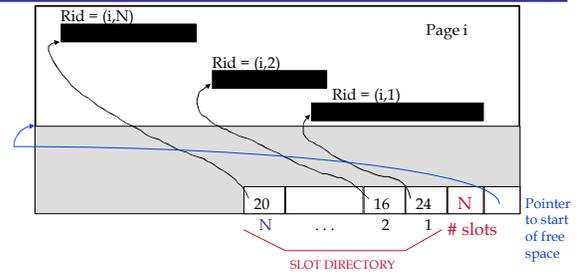

Page Formats: Fixed Length Records

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

Page Formats: Variable Length Records

* Can move records on page without changing rid; so, attractive for fixed-length records too.

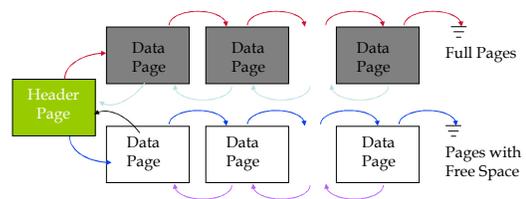

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

Unordered (Heap) Files

- Simplest file structure contains records in no particular order.
- As file grows and shrinks, disk pages are allocated and de-allocated.
- To support record level operations, we must:
 - keep track of the *pages* in a file
 - keep track of *free space* on pages
 - keep track of the *records* on a page
- There are many alternatives for keeping track of this.

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

Heap File Implemented as a List

- The header page id and Heap file name must be stored someplace.
- Each page contains 2 pointers plus data.

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

Heap File Using a Page Directory

- The entry for a page can include the number of free bytes on the page.
- The directory is a collection of pages; linked list implementation is just one alternative.
 - *Much smaller than linked list of all HF pages!*

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

Indexes

- A Heap file allows us to retrieve records:
 - by specifying the *rid*
 - Usually *<page id, slot number>*, or some integer (need lookup table for corresponding page id and slot number)
 - by scanning all records sequentially
- Sometimes, we want to retrieve records by specifying the *values in one or more fields*, e.g.,
 - Find all CS students with a *gpa > 3*
- Indexes are file structures that enable us to answer such *value-based queries* efficiently.

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

System Catalogs

- For each index:
 - structure (e.g., B+ tree) and search key fields
- For each relation:
 - name, file name, file structure (e.g., Heap file)
 - attribute name and type, for each attribute
 - index name, for each index
 - integrity constraints
- For each view:
 - view name and definition
- Plus statistics, authorization, buffer pool size, etc.
 - ** Catalogs are themselves stored as relations!*

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

Attr_Cat(attr_name, rel_name, type, position)

attr_name	rel_name	type	position
attr_name	Attribute_Cat	string	1
rel_name	Attribute_Cat	string	2
type	Attribute_Cat	string	3
position	Attribute_Cat	integer	4
sid	Students	string	1
name	Students	string	2
login	Students	string	3
age	Students	integer	4
gpa	Students	real	5
fid	Faculty	string	1
fname	Faculty	string	2
sal	Faculty	real	3

Database Management Systems, R. Ramakrishnan and Johannes Gehrke

Summary

- Disks provide cheap, non-volatile storage
- Buffer manager brings pages into RAM
- DBMS vs. OS File Support
- Fixed and Variable length records
- Slotted page organization
